

Erecton *Tablets*

For Erectile Dysfunction

Composition:

Each tablet contains:

- Sildenafil citrate 75 mg.

Properties:

Sildenafil is a selective phosphodiesterase type .. 5 inhibitor used in the management of erectile dysfunction. When sexual stimulation causes local release of Nitric oxide, inhibition of PDE type - 5 by Sildenafil causes increase of c GMP (cyclic guanosine monophosphate) in the corpus cavernosum, resulting in smooth muscle relaxation & inflow of blood to the corpus cavernosum.

Sildenafil at recommended doses has no effect in the absence of sexual stimulation.

Indications:

Erecton is indicated for the treatment of erectile dysfunction either:

- physiological [due to stress, mental depression, or anxiety about sexual performance] , or**
- organic [due to androgen deficiency, neurologic dysfunction, peripheral vascular disorder or penile abnormality, or**
- secondary to another disease such as diabetes, or**
- drug – induced impotency.**

Dosage:

- The recommended dose is one tablet to be taken one hour before sexual activity.

- The maximum recommended frequency is once daily.
- Erecton ... should not be taken more often than once in 24 hours.

Adverse Effects:

Adverse effects most commonly reported from sildenafil are... headache, flushing & dyspepsia, there may be visual disturbances, dizziness & nasal congestion.

Packing:

- One strip x 4 tablets.
